

International Conference: The pathway for efficient utilization of small diameter wood
Uppsala (Sweden), 1st June 2022

BUSH HARVESTING, PILOT STUDIES ON RETRABIO AND BIOBALER

Prof. Dr. Eduardo Tolosana

Universidad Politécnica de Madrid (UPM), Spain

1. Retrabio

Mulcher-collector RETRABIO:

- Rotor with 36 hammers rotating upward on the machine front.
- Flywheel and discharge spout
- 24 m³ container

1.A Salix coppice systematic mulching and biomass collection

Location

As Pontes (A Coruña)

Tasks (28 September- 2 October 2020)

- INVENTORY: 28 circular plots (2 m radius):
 - Stand conditions including scrubs
 - Weight of different *Salix* stools/moisture content samples
- Detailed – continuous - TIME STUDY
- Scaling extracted biomass /moisture content samples
- POST-TREATMENT INVENTORY ALONG TRANSECTS perpendicular to mulched strips: 26 circular plots (1 m radius):
 - Stand conditions after the treatment
 - Stand/soil damages characterization
 - Stump height and status
 - Weight of downed woody material/moisture content samples

sampling-
weighing

Results

N (tree/ha)	Tree h (m)	DBH (cm)	Tree canopy cover (%)	Shrub h (m)	Shurb canopy cover (%)	Fresh weight (t/ha)	ODt/ha
36321 (10435)	5.6 (1.1) (h max)	2.23 (0.79)	79.2 (16.7)	1.9 (0.6)	48.5 (38.0)	57.6 (28.1)	30.6 (15.0)

Results

Treated area (ha): 0.557

Odt·ha⁻¹ before treatment: 30.6

Machine speed while brushcutting (km·h⁻¹): 0.8

Total travelled distance (m): 844

Extracted dry biomass (ODt): 2.77

% Extracted/Standing biomass ≈ 45%

Productive machine hours (PM₁₅h): 1 h 41 min

Time study

- Productivity reached 3.58 fresh tonnes/Productive hour = 1.86 ODt/Productive hour.
- Productivity = 1.64 ODt/PM15h
- Economic Balance (for roadside biomass price 20 €/fresh t): - 205.6 €/ha⁻¹ (*)

(*) Hourly costs from Esteban, L. S. *et al.*, 2017

Phase	Time	%
Empty movements	0:05:24	5%
Mulching/collection	1:01:04	60%
Manoeuvring/changing striproad	0:12:23	12%
Loaded movements	0:02:57	3%
Unloading	0:06:42	7%
Planning	0:03:05	3%
Other breaks	0:09:31	9%
TOTAL	1:41:06	100%

Productivity model

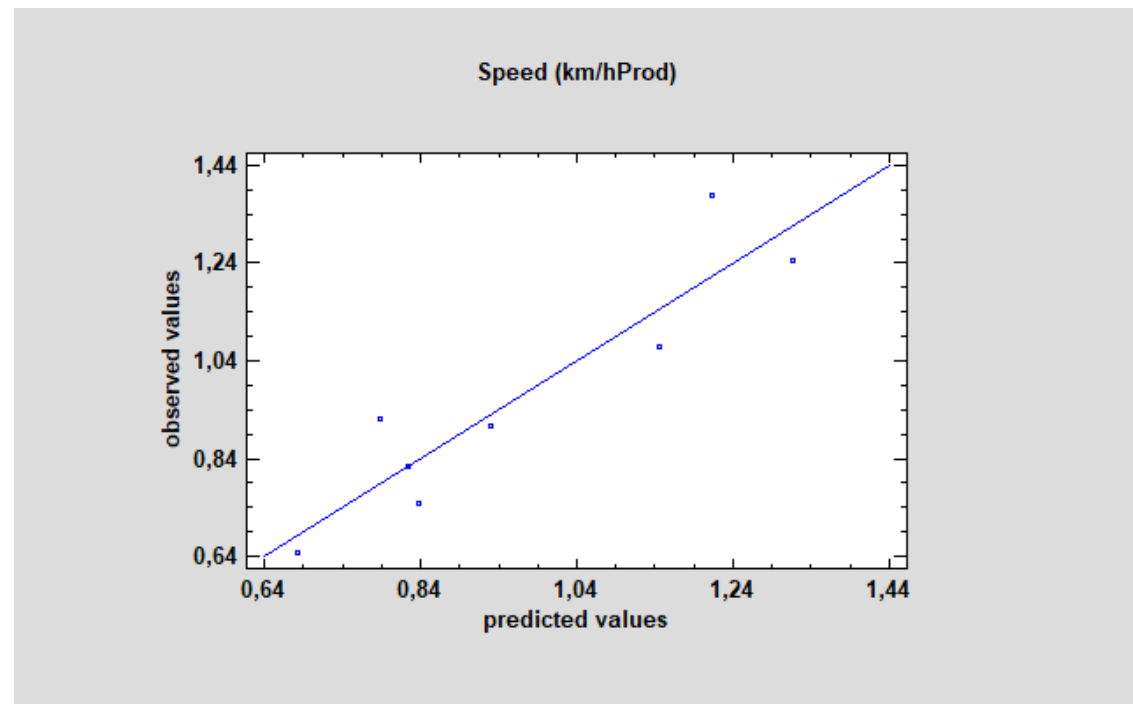

$$V \text{ (km} \cdot \text{ProdH}^{-1}\text{)} = 4.06 - 0.0000207 \cdot \text{Ntrees} \cdot \text{ha}^{-1} - 0.385 \cdot \text{Hmax, m} - 0.0297 \cdot \text{SBV (Shrub Cover, \%} \cdot \text{Shrub aver. Heigh, m.)}$$

(adj $R^2 = 0.73$, $P=0.042$)

$$\text{Prod (ha} \cdot \text{ProdH}^{-1}\text{)} = 1000 \cdot V \text{ (km} \cdot \text{ProdH}^{-1}\text{)} \cdot (2.75 + \text{USW -Untreated strips' width -, m}) / 10000$$

$$\text{Prod (ha} \cdot \text{ProdH}^{-1}\text{)} = 0.1 \cdot (4.06 - 0.0000207 \cdot \text{Ntrees} \cdot \text{ha}^{-1} - 0.385 \cdot \text{Hmax, m} - 0.00297 \cdot \text{SVB}) \cdot (2.75 + \text{USW, m})$$

1.B Pine post-fire regeneration systematic mulching and biomass collection: wildfire preventive treatment

Gondulfes forest, Verín (Orense)

Surface: 638 ha

Ownership: Gondulfes and Marbán villagers community

Tasks (March-May 2021)

- INVENTORY: 85 circular plots (2 m radius):
 - Stand conditions including scrubs
 - Weight of 28 *Pinus* trees/moisture content samples
- Detailed – continuous - TIME STUDY
- Scaling extracted biomass /moisture content samples
- POST-TREATMENT INVENTORY in 32 2,75x1 m plots located along the mulched strips:
 - Stand/soil damages characterization
 - Stump height and status
 - Weight of downed woody material/moisture content samples
- Productivity equations fitting – cost estimations

P. pinaster, *Erica cinerea*, *Genista tridentata*, *Ulex europaeus* y género *Halimium*

INVENTORY RESULTS (SD in parentheses)

N (trees/ha)	Tree h (m)	DBH (cm)	Tree canopy cover (%)	Shrub h (m)	Shurb canopy cover (%)	Green weight (t/ha)	ODt/ha
4126 (3071)	1.9 (0.67)	2.9 (1.4)	37.6 (23.9)	0.5 (0.17)	22.7 (21.1)	21.0 (17.4)	8.49 (7.03)

MULCHING – BIOMASS COLLECTION TRIAL

31 mulching strips 2.75 m wide
GPS georeferenced

Trial Surface = 1.44 ha

TIME STUDY

Work elements over attendance time (%)

- Mulching-collecting
- Empty movement
- Manoeuvre-Change of strip
- Loaded movement
- Unloading
- Planning
- Other breaks

Productive time: 2:08:03 (83,8 %)

Mulching/collecting time: 1:18:12 (51,18 %)

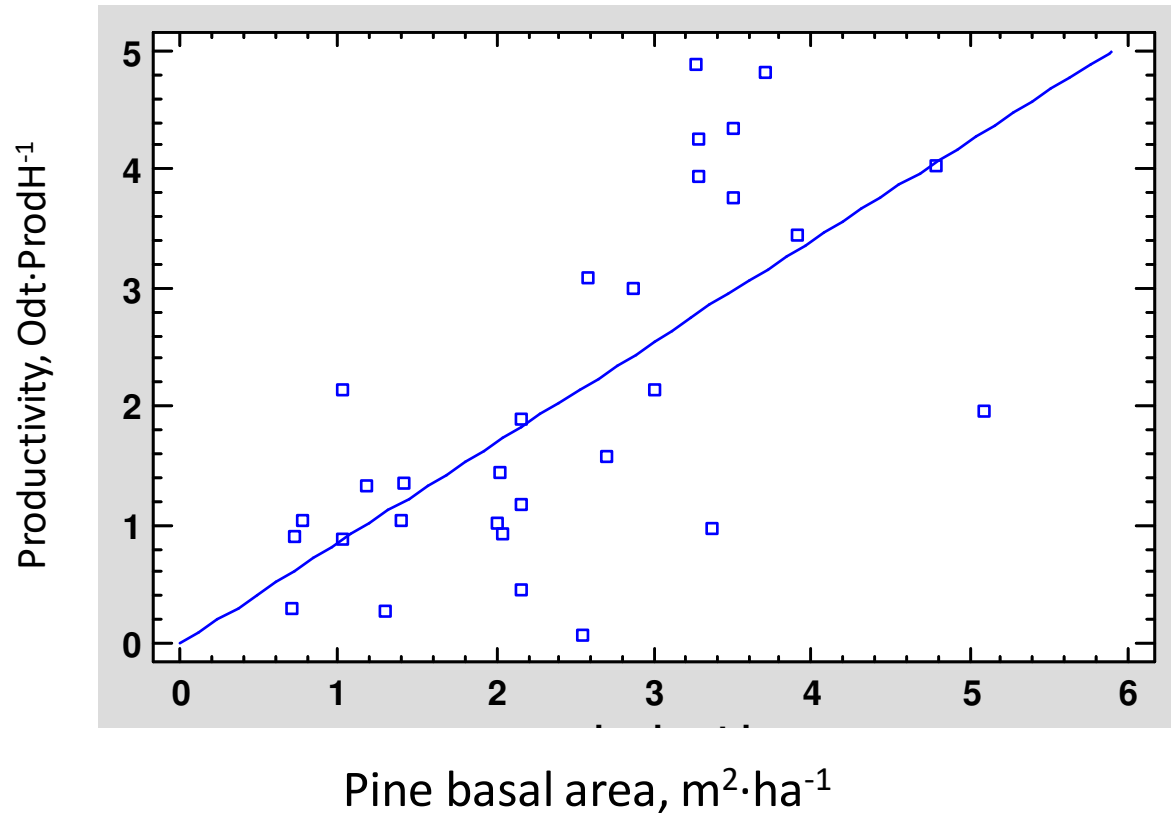

Speed and Productivity calculation

Surface Productivity = $0,67 \text{ ha} \cdot \text{ProdH}^{-1}$

Hourly cost = $112.0 \text{ €} \cdot \text{ProdH}^{-1}$

PRODUCTIVITY MODELS

Fitted equation	Adjusted R ² %	MAE	D-W
Productivity (fresh tonnes·ProdH ⁻¹) = 2.08·BASAL AREA (m ² ·ha ⁻¹)	44,5	2,10	1,13
Productivity (ODt·ProdH ⁻¹) = 0.848·BASAL AREA (m ² ·ha ⁻¹)	45,2	0,84	1,14

COST ESTIMATION

MULCHING AND COLLECTION

$$\text{Cost FM} = 45.12 \text{ €} \cdot \text{Fresh tonne}^{-1}$$

$$\text{Cost DM} = 95.64 \text{ €} \cdot \text{ODt}^{-1}$$

$$\text{Cost per hectare} = 166.05 \text{ €} \cdot \text{ha}^{-1}$$

TRANSPORT TO POWER PLANT

$$\text{Cost FM} = 10.07 \text{ €} \cdot \text{Fresh tonne}^{-1}$$

$$\text{Cost DM} = 21.39 \text{ €} \cdot \text{ODt}^{-1}$$

$$\text{Cost per hectare} = 37.14 \text{ €} \cdot \text{ha}^{-1}$$

+ 13% INDIRECT & FIXED COSTS + 6% INDUSTRIAL PROFIT

$$\text{Cost FM} = 65.67 \text{ €} \cdot \text{Fresh tonne}^{-1}$$

$$\text{Cost DM} = 139.26 \text{ €} \cdot \text{ODt}^{-1}$$

$$\text{Cost per hectare} = 241.79 \text{ €} \cdot \text{ha}^{-1}$$

INCOME = 40 € · Fresh tonne⁻¹ at
powerplant gate

Conventional mulching vs RETRABIO

Cost with a chain mulcher: $-185.6 \text{ €}\cdot\text{ha}^{-1}$

Cost with RETRABIO: $-94.57 \text{ €}\cdot\text{ha}^{-1}$

SAVINGS OF $91.03 \text{ €}\cdot\text{ha}^{-1}$ COMPARED TO CONVENTIONAL
MULCHING

2. Biobaler

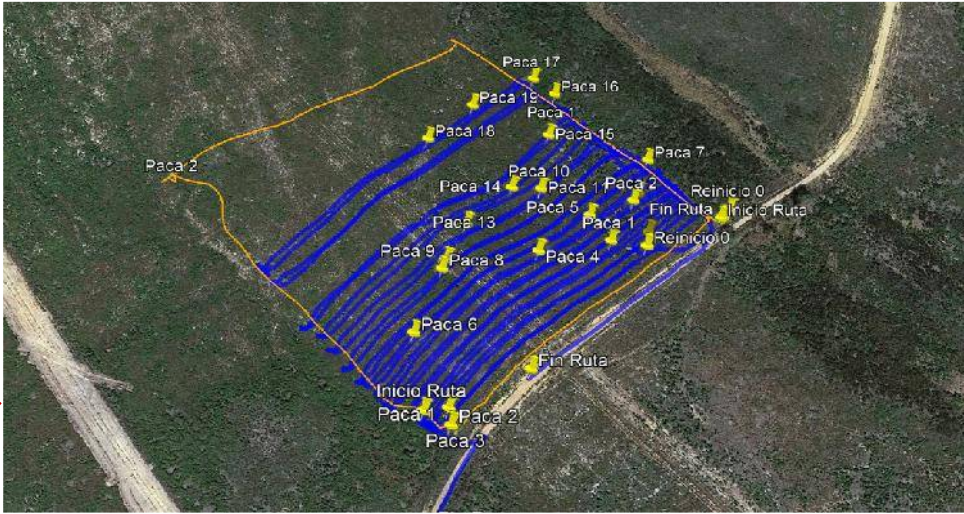

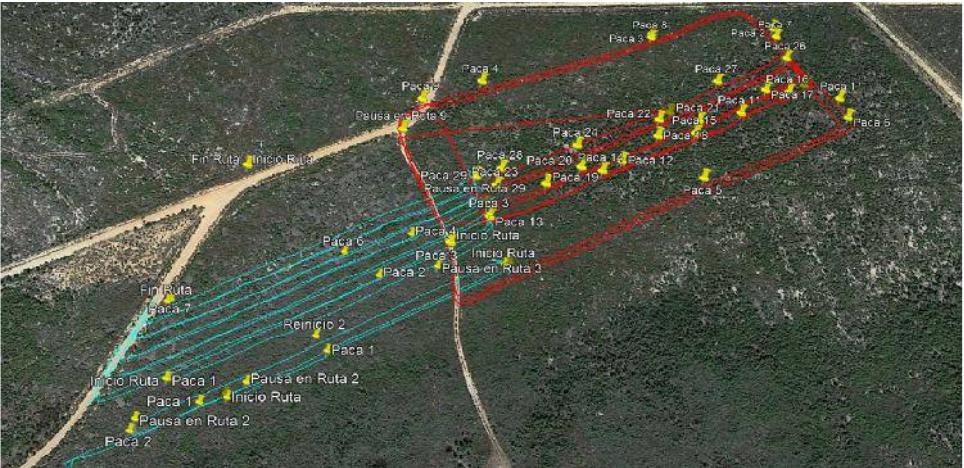

Mulcher-Bundler BIOBALER WB-55:

- Biobaler WB55 is an alternative to conventional chain or hammer mulchers.
- It collects woody material from 1 to 10 cm diameter, using a continuous technology of mulching and bundling in bales 1.2 m wide and 1.2 m diameter
- Baling eases extraction, transport, stockage and further handling for energy or bioproducts production.

Trials in Castrocontrigo and Tabuyo del Monte forests (León, Spain)

Wildfire preventive treatments by systematic mulching with mulching strips 2.65 m wide, with untreated strips with similar width (Wide) or half width (Narrow). Comparison with conventional mulcher.

MULCHING AND BUNDLING TRIALS

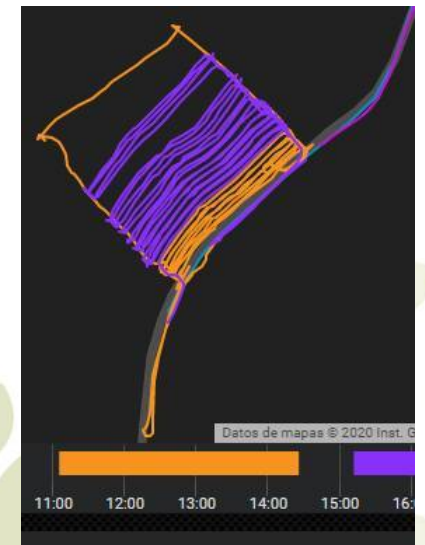

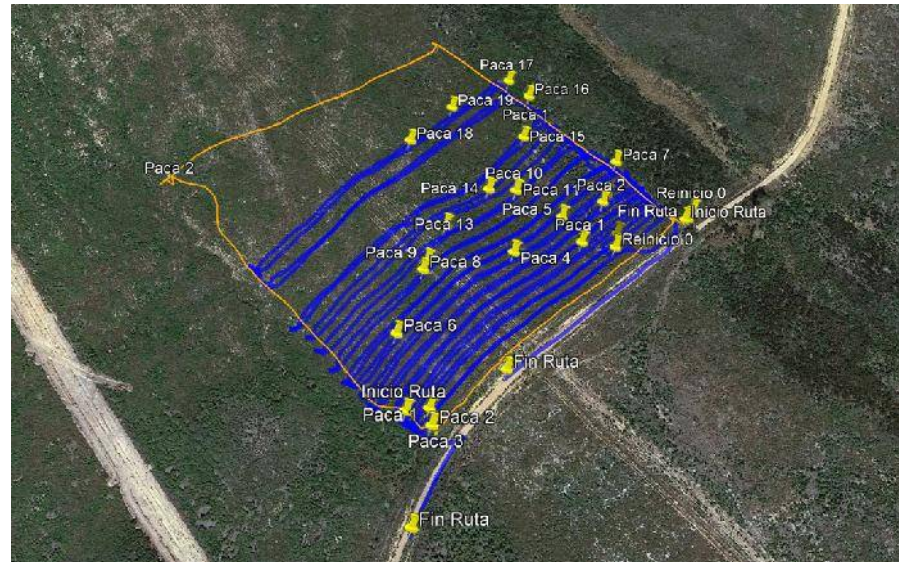

Biobaler trials Surface = 7.15 ha

Site 1: Two plots with 1.4 vs 2.6 m wide untreated strips

Site 2: : Other two plots with 1.6 vs 3.2 m wide untreated strips

Tasks (October-November 2020)

- Sampling (frequency) time study
- Bundles geolocation and numbering / moisture content samples
- Post-treatment inventory along the strip roads:
 - Weight of downed woody material / moisture content samples
 - Average height and canopy cover of trees and shrubs
 - Stand/soil damages characterization
 - Stump height
- Scaling extracted biomass / moisture content samples

Results

Treated area with BioBaler: 7.15 total ha (4.36 ha mulched)

Dry tonnes / bale (ODt): 0.179

Machine speed while brushcutting-bundling (km/h): 2.75

Biobaler stratum characteristics (the different superscript letters indicate statistically significant differences at 95% probability). Acronyms: N, narrow; W, wide; CC, crown cover; h, height.

Site	Stratum (% of Systematically Cleared Surface)	Pine Biovolume (CC,%·h,m)	Shrubs Biovolume (CC,%·h,m)	Total Biovolume (Pine + Shrubs)	Stumps Average Diameter, cm
1	N (59%)	20.7 ^a	49.4 ^a	70.1 ^a	1.0 ^a
	W (50%)	91.9 ^b	6.2 ^b	98.1 ^b	3.2 ^b
2	N (62%)	10.7 ^a	54.5 ^a	65.2 ^{a,b}	1.6 ^c
	W (46%)	30.9 ^a	53.9 ^a	84.8 ^{a,b}	1.8 ^c

Results

MAIN FIGURES: COLLECTION EFFICIENCY

Biobaler collection efficiency (the different superscript letters indicate statistically significant differences at 95% probability). Acronyms: N, narrow; W, wide; odt, oven dry tonne; ha, hectare.

Site	Stratum (% of Systematically Cleared Surface)	Biomass Left on the Ground, odt·ha ⁻¹	Collected Biomass Weight, odt·ha ⁻¹	Total Biomass Weight, odt·ha ⁻¹	Collection Efficiency, %
1	N (59%)	3.0 ^a	1.35 ^a	4.31 ^a	29.8 ^{a,b}
	W (50%)	4.9 ^b	3.41 ^b	8.35 ^b	41.6 ^a
2	N (62%)	3.5 ^{a,b}	1.44 ^a	5.09 ^a	33.1 ^a
	W (46%)	3.7 ^{a,b}	0.88 ^a	4.63 ^a	20.4 ^b

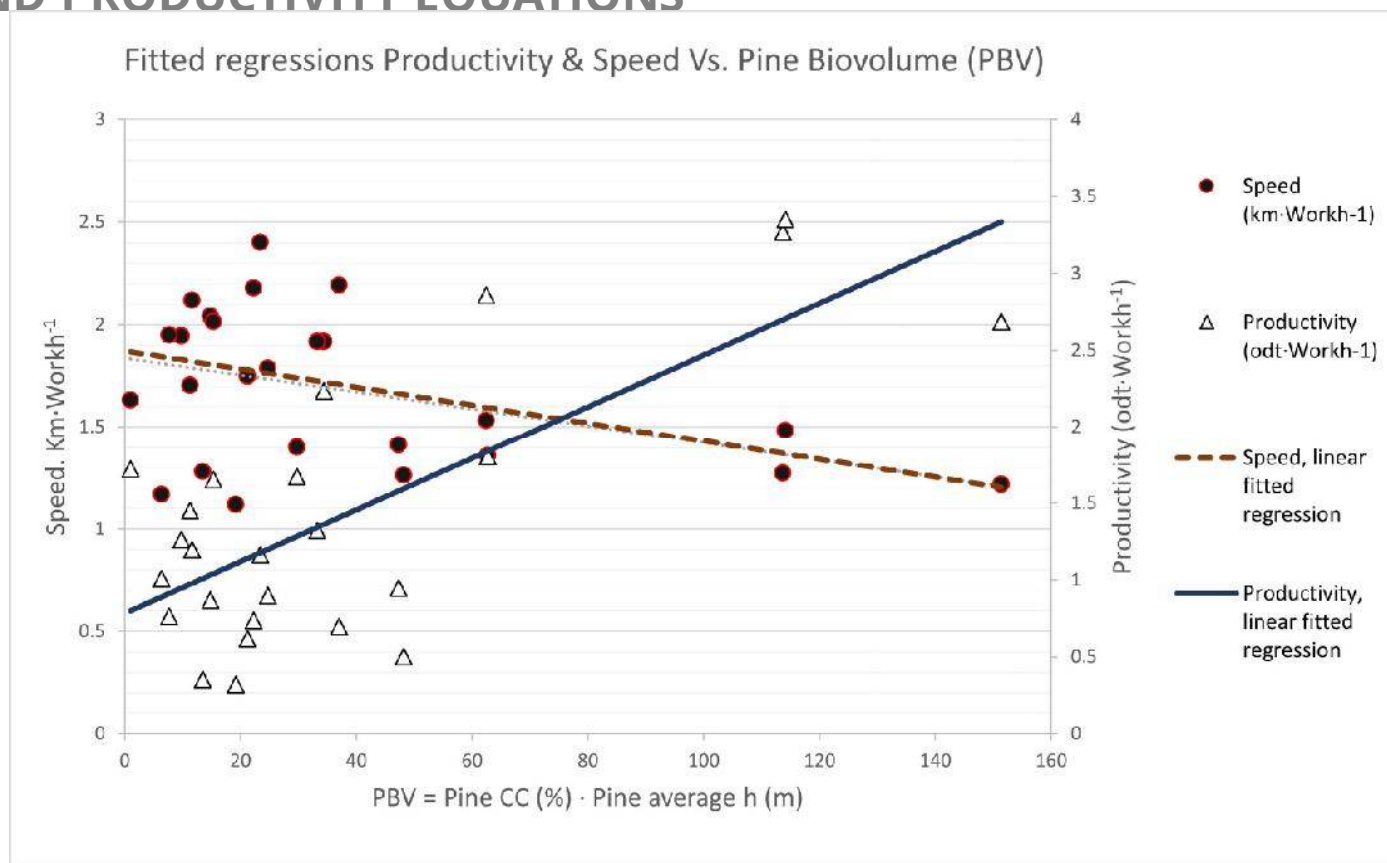

The average weight and surface productivity was 1.41 odt·Workh⁻¹ and 0.75 ha·Workh⁻¹ (0.45 cleared ha·Workh⁻¹)

Results

SPEED AND PRODUCTIVITY EQUATIONS

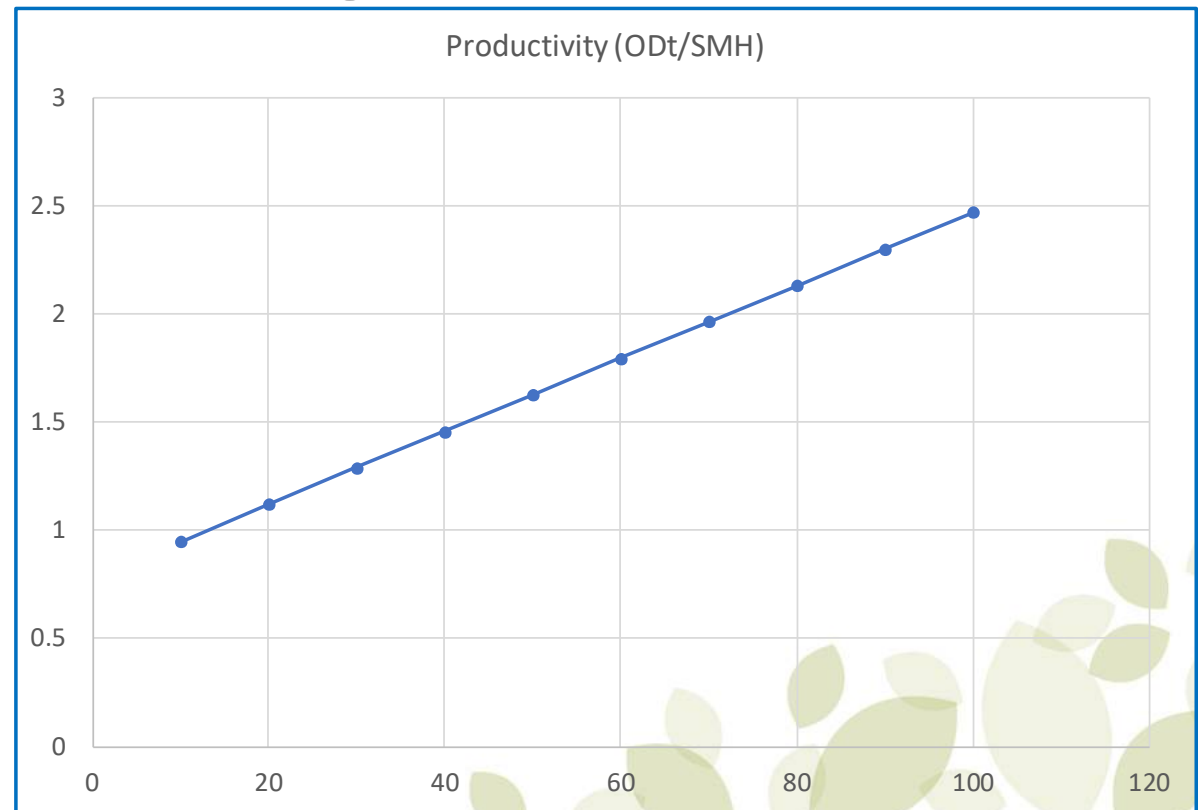

BIOBALER

Productivity

$$P \text{ (OD t / h SMH)} = (783,45 + 16,86 \cdot PB) \cdot 10^{-3}$$

PB= Pine biovolume (canopy cover, % x height, m)

$$R^2 = 53,5$$

CHAIN MULCHER STUDY PLOTS

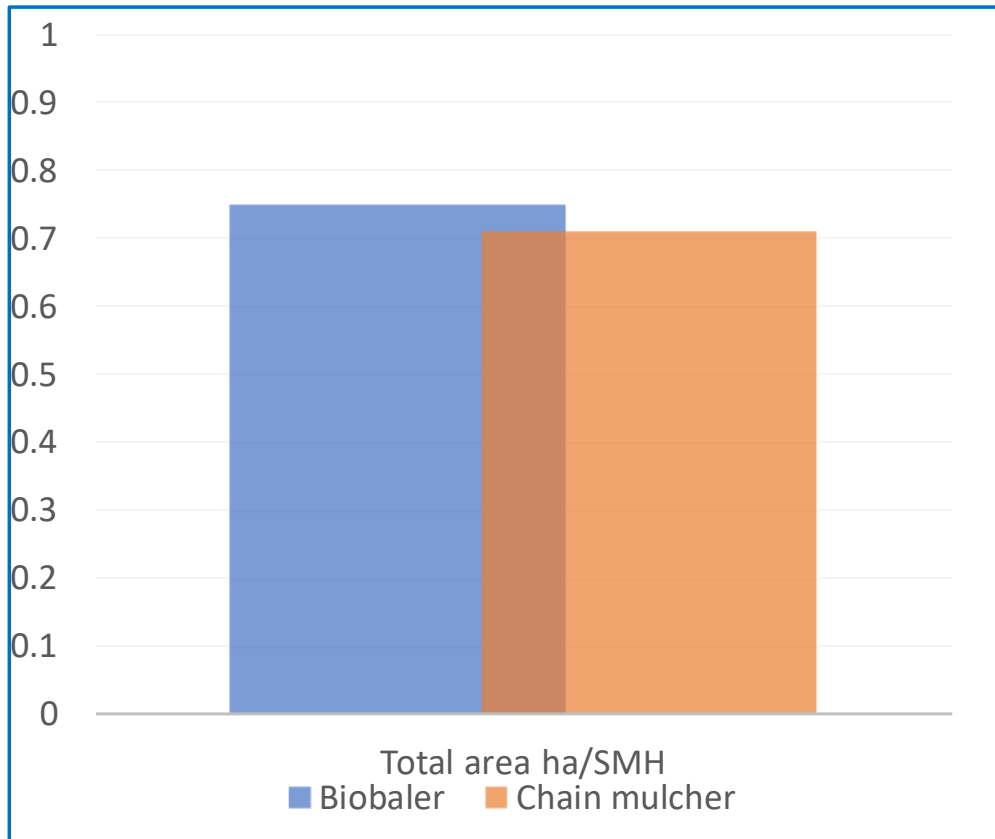

2 Sites, 2 Wide and narrow strips strata per site (surface mulched: 2.32 out of 4.70 total ha)

BIOBALER VS CHAIN MULCHER PRODUCTIVITY

Surface per SMH

Statistical analysis motormanual clearing

Productivity: Total Surface (ha) per WH and worker (team of 4 workers equiped with clearing saws)

COST

€·ha⁻¹ for the 4 tried alternatives

CONCLUSSIONS

- ✓ **RETRABIO** PERMITS THE TREATMENT OF **VERY DENSE SALIX COPPICES** AT A COST OF SLIGHTLY MORE THAN 200 €·HA⁻¹. THE **PRODUCTIVITY DEPENDS NEGATIVELY OF DENSITY, TREE SIZE AND SHRUB BIOVOLUME** (COVERAGE% *SHRUB HEIGHT).
- ✓ **RETRABIO** TECHNOLOGY DOES NOT PERMMIT SELF-FINANCING **WILDFIRE PREVENTIVE TREATMENTS ON POST-FIRE REGENERATED VERY YOUNG PINE STANDS**, BUT, IN THE STUDIED CONDITIONS, **ALLOWS SAVING 49% IF COMPARED WITH THE MOST COMMON ALTERNATIVE TREATMENT** (HAMMER MULCHER), BESIDES COLLECTING BIOMASS. THE **PRODUCTIVITY DEPENDS POSITIVELY OF BASAL AREA**.
- ✓ UNDER THE STUDIED CONDITIONS, **BIOBALER IS NOT COST-COMPETITIVE WITH THE ALTERNATIVE TECHNOLOGY FOR SYSTEMATIC-SELECTIVE CLEARINGS OF POST-FIRE REGENERATED VERY YOUNG PINE STANDS**, BECAUSE ITS **LOW COLLECTION EFFICIENCY** AND BECAUSE THE STUMPS LEFT ON THE MULCHED SURFACE **DIFFICULTS THE SELECTIVE TREATMENT WITH PORTABLE CLEARING SAWS**.
